## Financialization as a Strategy of Workplace Control in Professional Service Firms

### Abstract

Recently, there has been an increased focus on finance as a form of control in corporations. In this paper, we explore financialization as an employee control strategy in a Big Four accountancy firm, and more specifically how it affects the everyday lives of the professionals within the firm. We found financialization involved attempts to transform employees working lives into an investment activity where work was experienced as 'billable hours' that are 'invested' in the hope of a high future pay-off. Employees sought to increase the value of their investment by skilful manipulation. If wisely managed, this investment could yield significant benefits in the future. We argue that financialization involves active employee participation and is a way of binding other forms of control together.

Key words: Professional Control; Financialization; Performance Management; Professional Service Firm.

## 1. Introduction

According to some commentators, we have now entered an age of financialization (e.g. Martin, 2002; Erturk et al, 2008; Davis, 2009). Despite some concerns about the fuzziness of the concept (Engelen, 2008), researchers have noted the increasing importance of speculative financial instruments in the shaping of the economy (e.g. Boyer, 2000; Froud et al, 2001; Krippner, 2005; Palley, 2007), and financial aspects have become central to the management and control of corporations (e.g. Aglietta & Breton, 2001; Roberts et al, 2006; Froud et al, 2006). Anglo-Saxon corporations are now often run by CEOs from financial or legal backgrounds (Fligstein, 1990), and financial groups seek to extend their control over large corporations (Davis & Thompson, 1994). Shareholder value has become a dominant logic within some firms (Froud et al, 2000; Fiss & Zajac, 2004) and senior managers have become increasingly responsive to financial agents such as fund managers (Roberts et al, 2006). Various aspects of organizational life are now dominated by financial technologies (Ezzamel et al, 2008) and the result is that while in past, corporations may have been controlled by management and managerial knowledge (Grey, 1999), today they are controlled by financiers and financial knowledge (Davis, 2009).

Professional service firms such as lawyers, consultants and accountants (Froud et al, 2006; Carter & Mueller, 2006; Quack, 2007) play an important role in the process of financialization (Folkman et al, 2007). While we know that

1  
2  
3  
4 professional service firms (PSFs) have been an important agent of the  
5  
6 financialization process, we know less about whether these PSFs are themselves  
7  
8 the target of financialized forms of control. Recent work on law firms suggests  
9  
10 many forms of financial control in large corporations, such as 'economic value  
11  
12 added' or 'profit per equity partner' measures, have become common  
13  
14 (Faulconbridge & Muzio, 2009). This has driven extensive restructuring of  
15  
16 employment, and has become the core indicator of firm success. However, what  
17  
18 remains to be seen is how these forms of financialized controls affect the control  
19  
20 of professionals' work. To address this gap we would like to ask *how financialized*  
21  
22 *forms of controls have been applied to employees in professional service firms.*  
23  
24  
25  
26  
27  
28  
29  
30

31 In order to explore this question, we have decided to examine systems of control  
32  
33 in one PSF. Existing studies have identified various control strategies mobilized  
34  
35 by PSFs including recruitment, human resource management, management by  
36  
37 objectives, career systems and client control. All these were present in the  
38  
39 organization which we studied. However, we also noticed that in our case, these  
40  
41 control strategies were bound together by the drive to financialize employees'  
42  
43 working lives. Broadly this involves attempts to transform the professional service  
44  
45 employees into 'investor subjects' (Knights, 1997; Langley, 2007, 2008), whose  
46  
47 working lives are increasingly disciplined by financialized technologies, mirroring  
48  
49 the processes apparent in market transactions (Barley & Kunda, 2004). These  
50  
51 technologies gave their working lives monetary value that could be invested,  
52  
53 traded, speculated and leveraged. It occurred through employees seeking to  
54  
55  
56  
57  
58  
59  
60  
61  
62  
63  
64  
65

1  
2  
3  
4 transform activities in the workplace into billable hours. Moreover, we noticed that  
5  
6 employees would put significant effort into manipulating the system in a way that  
7  
8 made their activities 'billable'. The billable hours were subsequently 'invested' by  
9  
10 employees with the expectation that they would render future returns. The value  
11  
12 of this 'investment' was manipulated through various formal performance  
13  
14 management techniques that sought to put a price on performance and 'soft'  
15  
16 skills. Finally, we found that the commodity of billable hours was traded through  
17  
18 employees seeking to off-load less profitable billable hours and invest (albeit  
19  
20 briefly) in more profitable ones. By doing this, they hoped to increase their stock  
21  
22 of capital (billable hours) with the intention they could eventually convert this into  
23  
24 partnership. This resulted in a 'financialization' of control whereby everyday work  
25  
26 became understood as a kind of investment that should be wisely manipulated so  
27  
28 the employee could later reap the benefits. Not only did this profoundly impact  
29  
30 how employees experienced their working lives, it also had an impact on their  
31  
32 behaviours. In particular, it transformed how they used their time and changed  
33  
34 the kinds of projects they pursued.  
35  
36  
37  
38  
39  
40  
41  
42  
43  
44

45  
46 By attending to financialization as a control strategy in PSFs we seek to make  
47  
48 three contributions. First, we extend the literature on control in PSFs (e.g.  
49  
50 Covalleski et al, 1998; Morris & Pinnington, 1998; Anderson-Gough et al, 2000;  
51  
52 Alvesson, 2004). In particular, we argue that financialization is an important but  
53  
54 under-recognised form of control in PSFs (see also Faulconbridge & Muzio,  
55  
56 2009). Secondly, we extend the growing literature on financialization of corporate  
57  
58  
59  
60  
61  
62  
63  
64  
65

1 control (e.g. Fligstein, 1990; Froud et al, 2006; Davis, 2009). We do this by  
2  
3  
4  
5  
6  
7 pointing out that this involves not only shifts in who controls firms and the rise of  
8  
9 financial monitoring technologies, but it also shifts in how employees are  
10  
11 controlled in the workplace in their everyday activities. In particular, we show that  
12  
13 financialization comes to infiltrate the life-world and activities of employees,  
14  
15 making them into 'investor subjects' (Martin, 2002; Erturk et al, 2008). This  
16  
17 means that they experience their own work and behaviour as kinds of capital that  
18  
19 need to be wisely invested and traded in order to ensure a good return. Finally,  
20  
21 we make a contribution to recent studies of the disciplinary affect of  
22  
23 financialization processes (e.g. Knights, 1997; Roberts et al, 2006; Langley,  
24  
25 2007, 2008). We argue that financialization works as a disciplinary micro-control  
26  
27 strategy where people actively use, mobilize and invest in their career. It is  
28  
29 something that actually encourages active game playing, intervention and  
30  
31 entrepreneurial manipulation. While existing studies have tended to focus on the  
32  
33 sphere of consumption (e.g. Langley, 2008) or corporation-investor interaction  
34  
35 (e.g. Roberts et al, 2006), we extend these insights to the workplace, and more  
36  
37 particularly the control of professional service workers. This shows how such  
38  
39 financialized modes of control can operate in the contexts of some of the more  
40  
41 minute aspects of everyday workplace interaction.  
42  
43  
44  
45  
46  
47  
48  
49  
50  
51  
52

53 In order to make these contributions, we proceed as follows. We begin by  
54  
55 reviewing existing studies of workplace control in PSFs. We identify an important  
56  
57 aspect of control that has not been sufficiently explored – namely the logic of  
58  
59  
60  
61  
62  
63  
64  
65

1  
2  
3  
4 career, of 'investing' in oneself (Grey, 1994). We ask how this form of control has  
5  
6 played out in PSFs. We then outline our methods, followed by our findings. We  
7  
8 draw out three processes associated with financialized control in the workplace:  
9  
10 valuation, manipulation and arbitrage. We argue that each of these processes  
11  
12 lead to a financialization of workplace control. We conclude by drawing out the  
13  
14 contributions of the present study, the limitations and some lines for future  
15  
16 research.  
17  
18  
19  
20  
21  
22

## 23 **2. Control of Professionals**

24  
25  
26  
27  
28 In order to explore financialization as a form of employee control in PSFs, we will  
29  
30 begin by placing it into the context of other workplace control mechanisms.  
31  
32 Existing research has identified a range of sources of employee control in PSFs.  
33  
34 Firms can control through recruiting employees who have appropriate norms,  
35  
36 values and dispositions inculcated through education, family background and  
37  
38 early life experiences (Hanlon, 1996). The recruitment process itself makes  
39  
40 neophyte professionals feel they are part of an elite and thus increase their  
41  
42 commitment to the firm (Alvesson & Robertson, 2006). Once individuals join the  
43  
44 firm, Human Resource Management systems become an important conduit of  
45  
46 control (e.g. Aharoni, 1999; Maister, 1993). Rhetoric in PSFs typically  
47  
48 emphasizes 'soft' HRM systems based on commitment, skill and cultural  
49  
50 orientation. In reality, these 'soft' models appear side by side with 'hard' HRM  
51  
52 systems that treat employees as a factor of production (Legge, 1995: 67).  
53  
54  
55  
56  
57  
58  
59  
60  
61  
62  
63  
64  
65

1  
2  
3  
4 Management by objectives is also a typical control strategy, ostensibly providing  
5  
6 clear performance criteria and objective evaluations of these (Covaleski et al,  
7  
8 1998). One of the most potent forms of control in PSFs is the 'up or out' career  
9  
10 system. The core characteristic of this system is that an employee is only allowed  
11  
12 to stay at a certain level for a certain time, after which it is 'up or out'. At each  
13  
14 higher level, fewer places are available, and when at the top, one needs to fight  
15  
16 for one's existence by broadening the market or out-manoeuvring others (Baden-  
17  
18 Fuller & Bateson, 1990; Morris & Pinnington, 1998; Sherer, 1995). The result is  
19  
20 that employees must show significant commitment if they are to make a career  
21  
22 within the firm. In addition to these control systems within the firm, clients can act  
23  
24 as an important form of control. This happens when employees in PSFs are  
25  
26 pushed to put on professional displays to the client that model rationality and  
27  
28 client-centeredness (Clark, 1985; Power, 1997; Werr et al, 1997; Anderson-  
29  
30 Gough et al, 2000). Such strong identification with clients and demand to 'be  
31  
32 professional' often means that employees need to look like their clients: White,  
33  
34 male, middle class heterosexual is the norm, and any deviation from this has to  
35  
36 be carefully managed (Grey, 1994,1998; Haynes, 2008).  
37  
38  
39  
40  
41  
42  
43  
44  
45  
46  
47

48 Recruitment, human resource management, management by objectives, career  
49  
50 systems and client control are all well-known forms of control. Recently, a  
51  
52 number of commentators have pointed to the increasing importance of another  
53  
54 particularly powerful form of control in PSFs – financial technologies (e.g.  
55  
56 Faulconbridge & Muzio, 2009). These can come in range of forms from the  
57  
58  
59  
60  
61  
62  
63  
64  
65

demands of various financial intermediaries such as fund managers (Roberts et al, 2006), to complex technologies that compose and track the financial performance of firms against certain metrics (e.g. Froud et al, 2000), to far more subtle forms of self regulation where people begin to think of themselves and their various projects in financial terms (e.g. Martin, 2002). We might expect that the partnership-based ownership structure of many PSFs might make them fairly immune to the increasing influence of financial markets. However, this does not seem to be the case. For instance, some have argued that the far-reaching restructuring of law firms has been driven by the increasing obsession with various forms of corporate control (Faulconbridge & Muzio, 2009). Others have noted in passing that professional service employees experience their professional careers as a process of ‘investing’ in themselves (Grey, 1994). This appears to tap into what other commentators have noted is the process whereby financialized forms of control instil a sense of self-discipline into subjects (e.g. Knights, 1997; Aitken, 2007; Langley, 2007, 2008). We want to explore how this process of self-disciplining financialization plays out as a form of control in the context of PSFs.

### **3. The Study**

#### ***3.1 Setting***

In order to explore financialization in a PSF, we will focus on the results of a study of the Swedish part of a Big Four auditing firm. While the process of

1  
2  
3  
4 financialization is usually identified as originating in the US (Montgomerie, 2008)  
5  
6 the impact is present on a global basis. Changes in ideologies and institutions of  
7  
8 corporate control, changing financial technologies as well as mass savings  
9  
10 provide a context which increase demands on various actors to act as 'investors'  
11  
12 (Fligstein, 1990; French & Kneale, 2009; Langley, 2007; MacKenzie, 2006).  
13  
14 Sweden is a particularly interesting case, since whilst neoliberal pension reforms  
15  
16 in the '90s fuelled mass savings, and with this supported the dissemination of the  
17  
18 discourse of financialization, in general there seems to exist a significant  
19  
20 resistance and that 'financialisation lacks legitimacy in Sweden' (Belfrage, 2008:  
21  
22 278). Thus, the context can be seen as presenting a particularly unlikely  
23  
24 environment to find financialized control.  
25  
26  
27  
28  
29  
30  
31

32  
33 Specifically, the department for tax consulting (referred to as DM&I) is our focus.  
34  
35 Tax specialists are interesting because they have played an important role in the  
36  
37 process of financialization. They did this through helping large corporations to  
38  
39 minimize their tax burden (Sikka, 2009; Sikka & Willmott, 2010). Perhaps more  
40  
41 importantly, tax consultants have leveraged their position as knowledge brokers  
42  
43 between national tax collectors and corporate clients (Hasseldine et al, 2011).  
44  
45 The tax department is a specialty within the firm, sometimes working as back  
46  
47 office support to the accountants but also with their own clients. The work largely  
48  
49 concerns the structuring of various transactions in order to obtain tax  
50  
51 advantages. The tax consultants, almost exclusively with a law background, pride  
52  
53 themselves on being able to provide 'safe' solutions, which means solutions that  
54  
55  
56  
57  
58  
59  
60  
61  
62  
63  
64  
65

1  
2  
3  
4 will hold up in court. In fact, this sometimes requires them to hold clients back  
5  
6 from being too opportunistic in their behaviour. Furthermore, they see it as  
7  
8 important to take the whole business situation of the client into consideration  
9  
10 when giving advice.  
11  
12  
13  
14  
15

16 Two years prior to the study, there was a change of management in the firm.

17  
18 While the change process itself is not in focus in this paper, it provides an  
19  
20 important background for the case. Before the change, the firm was very similar  
21  
22 to the professional partnership (or P<sup>2</sup>) archetype as described by Greenwood et  
23  
24 al (1990). The structure was simple and informal. One partner nostalgically  
25  
26 described it as a situation where you had very few formal requirements and a  
27  
28 wide scope of possibilities. The subsequent development at DM&I mirrors the  
29  
30 findings of other studies which note how PSFs have moved towards more formal  
31  
32 forms of control and greater structural complexity (cf. Hinings et al, 1999).  
33  
34  
35  
36  
37  
38  
39

40 The most notable control technology involves the importance of registering  
41  
42 billable hours. This will be developed in more detail later; of importance here is to  
43  
44 note that formerly, the time spent on specific jobs were estimated before sending  
45  
46 the bill to the client, and the consultants kept informal notes on the time spent on  
47  
48 various jobs. With the management change, there was an increased emphasis  
49  
50 on the systematic registration of billable hours. A web-based reporting system  
51  
52 was put to use where the consultants submitted their time-use on a weekly basis.  
53  
54  
55  
56  
57  
58  
59  
60  
61  
62  
63  
64  
65

1  
2  
3  
4 The purpose of this was to increase the precision of the time reporting and also  
5  
6 to make it easier for the consultants to submit their reports.  
7  
8  
9

10  
11 Another important aspect is the HRM system. Formerly, personnel development  
12 was up to the individual and her or his ability to create productive mentorship  
13 relations. The HRM system is supposed to formalize this and ensure that each  
14 and every one gets the support s/he needs. The HRM system also seeks to  
15 systematize and homogenize the development process. A set of dimensions has  
16 been defined, through which the individual is supposed to develop in order to  
17 become a more productive consultant. Dimensions include communications  
18 skills, leadership skills, knowledge development and business acumen. A number  
19 of HR professionals have been hired in order to develop and formalize everything  
20 from recruitment via performance appraisals to exit management for those who  
21 leave the firm. The focus on HR has also materialized in things such as free gym  
22 cards, increased support for parental leave, and the possibility to get partial  
23 funding for a maid to take care of household chores. The discourse about the  
24 HRM system within the firm heavily emphasised the strategic importance of it.  
25  
26 The aim is that it will help the organization achieve its goal of becoming  
27 perceived as the best employer in the business, thereby increasing the supply of  
28 competent people. The tax consultants themselves are less enthusiastic. While  
29 most recognize the positive intentions, they also find it less important. As one  
30 laconically remarked when talking about performance appraisal: "When you get  
31 out of the room [from the appraisal] there's so much reality that you don't do  
32  
33  
34  
35  
36  
37  
38  
39  
40  
41  
42  
43  
44  
45  
46  
47  
48  
49  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60  
61  
62  
63  
64  
65

those things anyway.” Despite the cynicism towards these systems, the importance of billable hours and shifts in the HRM systems makes this an ideal case to explore how the dynamics of financialization and self-disciplining play out.

### ***3.2 Methodology***

The study is based on a broad methodological approach, drawing inspiration from ethnographic case study approaches (e.g. Rosen, 1985; Stake, 2000). The study took place during 2001–2003. During three phases of field work 42 semi-structured interviews were conducted with employees at all levels (See Table 1). Two of these interviews were conducted with former employees. Interviews lasted between 1 and 2 hours. All interviews have been transcribed verbatim and translated from Swedish. Initially, interviewees were asked to talk about their broader work situation (e.g. 'Tell me about your job'). The researcher then wrote down the topics that the respondent raised, using them as a starting point for follow-up questions. As the study developed, certain themes became more prominent, as the researcher's understanding of the empirical context developed. These helped to narrow the agenda of research questions that were asked. The three major offices in Sweden were visited. Also, informal observations of meetings, participating in and observing a Christmas party and some 'hanging around and asking questions' (Dingwall, 1997) were done. Finally, internal and

1  
2  
3  
4 official documentation (such as HRM documentation and employment policies)  
5  
6 were obtained and included in the analysis.  
7

TABLE 1 ABOUT HERE

As the research project progressed, the theme of billable hours emerged as important. When interviewed about the HRM system and performance reviews for instance, respondents constantly brought up the issue of billable hours. Also, in one of the offices a list with the latest billable hours report, allegedly for the office manager's eyes only, was publicly displayed at the table in the common room. Finally, we noticed that junior and senior employees related differently to billable hours, indicating that the system itself was maybe part of the socialization process for the professionals. All these indications led to a closer focus on the issue, in particular we sought to investigate the design of the system and examined how employees related to it.

Once we had collected the material, we then looked through all the data again for material related to the theme of billable hours and other forms of control. Through successive iterations between theoretical material on financialization and control in PSFs and the data, we identified three central issues which were raised: the transformation of time into money through the technology of billable hours, the attempt to accumulate these billable hours by employees in order to progress through the organization, and the various techniques which were used in order to accumulate these billable hours. Once we had identified each of these issues, we explored in more depth how each of these processes worked. This involved three

1  
2  
3  
4 aspects: Describing how processes actually worked; identifying the various  
5  
6 technologies which were involved; examining how employees responded and  
7  
8 how it impacted on their work lives. Once we did this, we were able to construct  
9  
10 an account of how each of the elements of financialization worked.  
11

14

## 15 16 **4. Findings**

### 17 18 19 20 21 ***4.1 Time is money***

22  
23  
24  
25  
26 As in PSFs in general (Kärreman & Alvesson, 2004), several forms of control  
27  
28 appear simultaneously at DM&I. There are mentoring programs, direct  
29  
30 supervision, performance appraisals, and a formal hierarchy consisting of  
31  
32 Assistants, Consultants, Managers, Senior Managers and Partners. Moreover,  
33  
34 the DM&I staff deem clients important. But the most apparent form of control is  
35  
36 billable hours (Brown & Lewis, 2011). We will return to the informal reasons for  
37  
38 this later, but there is also a clear official emphasis on this. In the words of a  
39  
40 partner working with HR:  
41  
42  
43  
44  
45  
46  
47

48 Put harshly, what we make a living of is billing for our work. And work in  
49  
50 consultancy is normally related to time, so to speak. That means that the  
51  
52 utilization totally determines the survival of the firm.  
53  
54  
55  
56  
57  
58  
59  
60  
61  
62  
63  
64  
65

1  
2  
3  
4 'Utilization' means the number of billable hours divided by full work-time working  
5  
6 hours, normally this is expected to be above 75 %. The accumulation of billable  
7  
8 hours is thought to operate like clockwork. Every hour worked gets reported into  
9  
10 the web-based accounting system and is assigned to a specific client project, all  
11  
12 on an individual self-reporting basis. Thus, one hour registered is supposed to  
13  
14 equal one hour worked. In the clients' view, the role of billable hours is important  
15  
16 in that it seems to be the basis for the total sum charged for a project or task.  
17  
18

19  
20 This is not correct however, since the bill is almost always a *post facto*  
21  
22 construction. Sometimes the amount of time spent on a specific job is less than  
23  
24 what can be charged to the client, and sometimes all the time spent cannot be  
25  
26 charged. Thus, there is no clear-cut relation between how much time is spent on  
27  
28 the job and how much the client is billed, even though the client's bill is written in  
29  
30 terms of hours spent. The client is billed in accordance to how much the job is  
31  
32 worth to the client and how price sensitive the client is.  
33  
34  
35  
36  
37  
38  
39  
40

41 In practice, registering billable hours is more difficult. For one thing, the auditors  
42  
43 must decide upon what counts as valuable work. One Partner told us: 'You are  
44  
45 supposed to debit all time spent on a task . . . but at the same time, it may be that  
46  
47 you head off in the totally wrong direction . . . there are always situations where I  
48  
49 can't bill millions of hours for something I cannot charge for.' Moreover, as an  
50  
51 Assistant remarked, 'you feel by yourself how effective you've been'. Thus, for  
52  
53 the person reporting their billable hours, a form of self-monitoring is always  
54  
55 apparent. Was I good enough? Will the client be willing to pay for this? Did I  
56  
57  
58  
59  
60  
61  
62  
63  
64  
65

1  
2  
3  
4 deliver good enough quality? The effect of this is that the professional often  
5  
6 devalues some of their work by not billing. Reporting billable hours is a question  
7  
8 of self-valuation and judgement.  
9

10  
11  
12  
13  
14 The ever-presence of billable hours is obvious. Working at DM&I often means  
15  
16 that several issues are on one's desk at the same time while incoming calls and  
17  
18 emails from clients or peers disrupt the workflow. In order to keep track of time,  
19  
20 several tactics are employed. Some use paper sheets with six-minute slots,  
21  
22 continually recording what they do, while others use spreadsheets on their  
23  
24 computers. A Consultant explains the way of managing this:  
25  
26  
27  
28  
29  
30

31 If I have a five-minute telephone conversation with a client, as a beginner I  
32  
33 recorded five minutes, 'ok, five minutes telephone call', but if so, I forget to  
34  
35 record the two minutes it takes to bring out my time report, they should go  
36  
37 in there too, and I forget the ten minutes it takes to open an account if the  
38  
39 client isn't already there, and I forget the ten minutes it takes to... If I have  
40  
41 given advice I have to take notes on it, for someone else to review and  
42  
43 also charge time for. So, often, tasks are more complex, and in the  
44  
45 beginning you tend to forget to enter all time.  
46  
47  
48  
49  
50  
51  
52

53 One common strategy to manage this extra time which cannot easily be allocated  
54  
55 to individual clients is to spread them over all projects at the end of the day in  
56  
57 order to not 'lose' time. Here, a possibility of manipulating the system arises,  
58  
59  
60  
61  
62  
63  
64  
65

1  
2  
3  
4 since if one is fortunate enough to have clients that are 'billing-insensitive', the  
5  
6 opportunities for adding some extra time on their report arises; this is called  
7  
8 'over-billing' and is possible, but the frequency by which it occurs varies between  
9  
10 hierarchical levels.  
11  
12  
13  
14  
15

16 All this self-monitoring is not something that disappears into an automatic routine.  
17  
18 An Assistant comments that 'you keep an eye on the watch all the time' and a  
19  
20 Consultant notes that 'all my time is devoted to thinking in six-minute intervals'.  
21  
22 Meetings that cannot be charged to a specific project are experienced as  
23  
24 frustrating and corridor talk is kept to a minimum. At the coffee machine there's  
25  
26 talk while you wash your cup and refill, then you rapidly return to work. The quiet  
27  
28 atmosphere of all the offices visited was striking.  
29  
30  
31  
32  
33  
34  
35

36 From these observations, it is quite clear that billable time is not as neutral as it  
37  
38 may appear. It enters into everyday practice of the professionals and as a form of  
39  
40 control. It also appears quite short sighted, as it always focuses employees on  
41  
42 the 'now'. Many express the opinion that there is a lack of objectives and visions,  
43  
44 and that billable time is all that counts. A Consultant said that 'the next week we  
45  
46 know about, because that's always about optimizing billable time [...] the rest is  
47  
48 sort of out in the blue somewhere.'  
49  
50  
51  
52  
53  
54  
55

56 The dominance of billable hours has a number of effects. Perhaps the most  
57  
58 obvious result is that the chaotic flow of the working day is transformed into  
59  
60  
61  
62  
63  
64  
65

1 something quantifiable. By pushing employees to record their time, they are  
2  
3  
4  
5  
6  
7 asked to apply the precisely quantifiable 'clock time' of the capitalist workplace to  
8  
9 each moment of their day (Thompson, 1967; Clark, 1985; Adam, 1990; Hassard,  
10  
11 1990). The flow of work-time and the strict structuring of clock-time often do not  
12  
13 neatly align, and we have seen that our respondents recognise that this is often a  
14  
15 highly artificial process. For instance, difficulties arise when recording time  
16  
17 involved in engaging in multiple tasks, transitioning between tasks, or engaging  
18  
19 in non-client related activities (cf. Anderson-Gough et al, 2001). The importance  
20  
21 associated with clock-time means that the tax consultants have to put significant  
22  
23 work into ensuring that every minute at work can relate to specific projects.  
24  
25  
26  
27  
28  
29  
30

31 Through quantification of time into six-minute slots, the organization is also able  
32  
33 to directly value an employee's time. By doing this, it becomes possible to make  
34  
35 a direct link between the time spent working on a particular issue and what is  
36  
37 charged to a particular client. Moreover, it becomes possible to assign value to  
38  
39 some kinds of activities and not to others (Anderson-Gough et al, 2001). In  
40  
41 particular, work which can be reported as billable hours is considered valuable,  
42  
43 while activities that cannot be clearly tied to billable hours are not valued by the  
44  
45 firm. This valuation seemed to work in two ways. Firstly, it works through creating  
46  
47 monetary value, as efforts are directed towards client activities. A strict link to  
48  
49 short term firm profitability is the result. Activities like internal projects or  
50  
51 competence development outside client relations are not encouraged. The  
52  
53 second way it works is through the construction of moral value. In particular, it  
54  
55  
56  
57  
58  
59  
60  
61  
62  
63  
64  
65

1  
2  
3  
4 constructs an image of what a 'good employee' is (cf. Anderson-Gough et al,  
5  
6 2000). Indeed, the technology of 'billable hours' collapsed these two aspects into  
7  
8 one another. One palpable example of this was the public display and an on-  
9  
10 going discussion between juniors of billable hours.  
11  
12  
13  
14  
15

16 A related effect of this process of quantification and valuation is that employees  
17  
18 begin to discipline themselves in order to ensure that their work time maximises  
19  
20 their billable hours (cf. Brown & Lewis, 2011). The strict focus on working  
21  
22 appeared to be the result of employees internalizing the notion of billable hours  
23  
24 and carefully accounting for all their own time in relation to this. They begin to  
25  
26 ensure that each hour could be attached to a specific project. The result is that  
27  
28 their experience and orientation to time becomes ordered and disciplined. They  
29  
30 begin to start 'thinking in six minute intervals'. This means that employees are  
31  
32 constantly forced to make judgements about what is valuable work by using the  
33  
34 sole criterion of whether it might be charged to a client or not. The result is that all  
35  
36 tasks that are not billable (or potentially billable) tend to be considered to have no  
37  
38 value. Other studies of accountants have found similar patterns. For instance, a  
39  
40 study of trainee auditors' orientation to time found that initially young auditors  
41  
42 would see 'available time' (i.e. time when they were not specifically assigned to a  
43  
44 task) as a benefit (Coffey, 1994). However, the young auditors quickly realised  
45  
46 that this non-chargeable time is something that should be avoided. The result is  
47  
48 that they actively sought to be, or at least look, busy. In DM&I, looking busy  
49  
50 means being able to charge one's hours out.  
51  
52  
53  
54  
55  
56  
57  
58

## 4.2 Investing in the Future

In PSFs, making a career is often a main objective for employees: 'People do not join professional firms for *jobs*, but for *careers*' (Maister, 1993: 6). This is also the case for consultants at DM&I. An HR-person claimed that 'climbing the corporate ladder is what they mean by personal development'. Partners are, in this regard, important role models in that they display what is expected in terms of career:

In the way of looking at work as, you could say, the work's part of your life. They have been career-focused. It's all work for them. Then you have a family on the side that the wife cares for.

This Consultant goes on to note that she and her generation will demand a better work/life-balance, since many have spouses that also have career-oriented jobs. Still, the up-or-out system clearly promotes advancement and careers, and, as noted by the HR-person mentioned above, people will not be content staying at lower levels forever; progression is the norm. Challenges and progression keep the tax consultants motivated (at least as they phrase it), and DM&I is generally considered to be an environment that facilitates development. Moreover, the career is not something that gets taken care of by anyone else or by bureaucratic systems. It is all up to the individual. The individual is understood as being in charge, and among partners it can even be seen as a career disadvantage to not take individualism seriously. Requiring too much assistance is a sign that you

1  
2  
3  
4 have not quite understood the rules of the game. 'It's all ad hoc', a Manager said,  
5  
6 and continued: 'It's you yourself who have to make sure you get to do what you  
7  
8 want to do, no-one else will do it for you.' One Manager told us that you 'have to  
9  
10 view it in a long-term perspective. The reward will come, but it will not come in  
11  
12 this month's time-report.' As this Manager sees things, working hard at DM&I is  
13  
14 an investment that will pay off in the future. Some are, however, not sure whether  
15  
16 the investment will pay off. One Consultant noted that becoming a partner 'is all  
17  
18 about making money for the firm. And maybe my drive is not strong enough to  
19  
20 progress very fast. We'll see.' For some, practical circumstances make the career  
21  
22 an all too insecure investment. One employee noted:  
23  
24  
25  
26  
27  
28  
29  
30

31 We already have four partners here in [this city], and that's too many  
32  
33 already. So someone has to quit, and how old are they? The oldest is 51,  
34  
35 52. And they quit at 60. And the rest, they're not even 50 the rest of them.  
36  
37 So before they appoint any new partners [here], it's a lifetime! [Laughs] It's  
38  
39 not something to strive for, I think. At least not for me.  
40  
41  
42  
43  
44  
45

46 Thus, the value of the future investment varies between different individuals, but  
47  
48 the idea that an amount of effort now will (or will not) pay off is an important way  
49  
50 of relating to work.  
51  
52  
53  
54

55 One reason the tax advisors 'bought into' the practice of billable hours was they  
56  
57 saw it as a necessary way of investing in their careers. The reasons given for this  
58  
59  
60  
61  
62  
63  
64  
65

1 includes personal development (becoming a better person), professional  
2 development (becoming better at the job), building status (getting respect in the  
3 firm and wider society), and economic reasons (getting the big payoff associated  
4 with partnership). This orientation to invest in one's career is certainly  
5 encouraged by particular technologies such as the up-or-out system. Moreover,  
6 the career becomes the responsibility for an individual to shape and build – not  
7 something that the organization automatically gives them (Hanlon, 1994). In  
8 other words, the career becomes an important disciplinary mechanism that  
9 employees actually buy in and begin to see as the royal road to self-development  
10 (Grey, 1994; Anderson-Gough et al, 2001). But the way they invest in this most  
11 precious of commodities is through the accumulation of billable hours. By  
12 accumulating billable hours, the employees are able to clearly show they are  
13 adding value to the firm. We also noted that most employees recognise that like  
14 any investment, there is a certain risk involved. This might be due to the period of  
15 pay-off being too long (e.g. due to older partners blocking their career  
16 progression), or due to the uncertainty around whether an employee will 'make it'  
17 in the up or out system. This meant that for many of our respondents, a career  
18 was something that they had to speculate in – they must stake their time and  
19 significant effort against the risky future outcome of 'making partner'.  
20  
21  
22

### 53 ***4.3 Quantifying Soft Skills***

54  
55  
56  
57  
58  
59  
60  
61  
62  
63  
64  
65

1  
2  
3  
4 As with most companies of its kind, DM&I have developed a formal rhetoric  
5  
6 emphasising human resource management. This is apparent in publications such  
7  
8 as the annual report:  
9

10  
11  
12  
13  
14 We aim to be the dominant consulting company on the Swedish market  
15  
16 when it comes to tax advice. In order to fulfil this aim we must provide our  
17  
18 client companies service of the highest quality. Our ability to provide such  
19  
20 service is depending on the collective competence and effort of our  
21  
22 employees [...]  
23  
24  
25  
26  
27

28  
29 Thus, developing its workforce is seen as an important target for DM&I. This is  
30  
31 also apparent in interviews, especially with senior partners, where there is a  
32  
33 general agreement on the importance of developing the employees. This also  
34  
35 regards 'soft' aspects, where a performance evaluation system has been  
36  
37 developed. It consists of several dimensions (including those mentioned in the  
38  
39 annual report). The list of dimensions is divided into two columns (see Table 2).  
40  
41 The idea is that 'Consultancy evaluation factors' are supposed to represent how  
42  
43 the 'Competence criteria' are realized in relation to clients. Each dimension is  
44  
45 supposed to be peer-reviewed and superior-reviewed twice a year (although in  
46  
47 practice, once a year seems to be the norm). Some consider the performance  
48  
49 reviews helpful, in the sense that they provide feedback, while most see them as  
50  
51 merely an administrative ritual.  
52  
53  
54  
55  
56  
57  
58  
59  
60  
61  
62  
63  
64  
65

TABLE 2 ABOUT HERE

One problem is how the 'soft' values are supposed to be weighted against 'hard' billable time. For instance, one of the 'soft' aspects, 'contributing to business profitability,' regards being a 'rainmaker,' i.e. being able to provide work to others. But when given the choice between putting billable hours on your own time report and handing the task to someone else, the former is perceived as the safer choice. Even more so when it comes to non-quantitative aspects such as helping and supporting others or spending time developing internal organizational issues, as a Consultant explains:

You gain nothing by being humble or spending time on things that can't be billed. If you can push those things away, get someone else to do it, spend time on at least looking like you're pulling in money, then... And this makes those on their way, those climbing the ladder, not always behave as you could perhaps wish...

Another claimed that 'this is the headquarters of egoistic behaviour'. It is quite clear that the general view is that 'hard' values, i.e. billable hours, are viewed as more important.

Despite the dominance of 'hard' measures of billable hours, there are some attempts to upgrade the importance of 'soft' values. For instance, one partner has

1  
2  
3  
4 developed a system for more precise measurement of 'soft' values. This lengthy  
5  
6 interview excerpt illustrates the line of reasoning and the difficulties encountered.  
7  
8 During the interview, the partner illustrated the spider web diagrams he used on a  
9  
10 piece of paper by drawing a diagram with several dimensions such as business  
11  
12 acumen, team building, and social competence (interviewer in *italics*):  
13  
14  
15

16  
17  
18 – All these components are there, and then you can, as I have done, draw  
19  
20 a circle with, what can it be, five or six arrows like this, where is says  
21  
22 business acumen... [drawing on paper] You must have a five here, then  
23  
24 you're a Partner, a four and you're a Manager, three and you're a  
25  
26 Consultant, two and you're an Assistant...  
27  
28

29  
30 – *And at one you've quit... [An attempt at irony that doesn't quite hit its*  
31  
32 *mark]*  
33  
34

35  
36 – And at one you've quit. When you look at a person, you look at business  
37  
38 acumen, look at social competence, look at material competence, and so  
39  
40 on, and you mark these with dots, you'll get a profile there...  
41  
42

43  
44 – *Spider web...*  
45

46  
47 – Exactly. And then you see that you made it on these [points with pencil],  
48  
49 but your business acumen is crap, because you never send out bills, you  
50  
51 never debit your clients, and so on. You'll never make partner if you  
52  
53 continue like this. Or you're sloppy generally... You're good at attracting  
54  
55 new clients, you're good at team building and you're good at, maybe,  
56  
57 leadership, but you you've got to make this work financially too. And then  
58  
59  
60  
61  
62  
63  
64  
65

1  
2  
3  
4 you can see, you can set a target for the next year, if you're going to  
5  
6 become a Manager, then you'll have to move your positions forward, from  
7  
8 two to four, right, two to five. Otherwise you're done for. Because if you ask  
9  
10 the question 'How come I'm not Manager?' 'No, because you remain  
11  
12 [knocks on diagram] there.'

13  
14  
15  
16 [...]

17  
18  
19 – *So how do you get these figures?*

20  
21 – Well, the figures, you have to do with... It's not that easy to measure, but  
22  
23 I have...

24  
25  
26 – *Let's say business acumen?*

27  
28 – But there is a lot of ingredients to that! [Self-confidently] Behind business  
29  
30 acumen there may be like ten different headings.

31  
32  
33 – *But then you get uncertainty in those values?*

34  
35  
36 – Well, it's not possible to... With absolute certainty...

37  
38  
39 – *But that's what I mean, it...*

40  
41 – The best would be if you could enter exactly, you can see that, ok, you  
42  
43 have... eight weeks out of ten you have handed in your time report too late.  
44  
45 And then I say you're going to get a one on that. You should, ten times out  
46  
47 of ten must be in time. I mean, of course it's possible to measure it exactly  
48  
49 eventually, but we're not there yet, but it will move towards greater  
50  
51 objectivity, towards creating demands for the employee and saying like  
52  
53 this: 'This doesn't work.' But it's hard. And we're at the beginning of a  
54  
55 process that will take like five to ten years before it has settled. This is a  
56  
57  
58  
59  
60  
61  
62  
63  
64  
65

1  
2  
3  
4 very complex area, it's also hard to get measurable figures in an adequate  
5  
6 way, and it will take some time, but it will pay off in the end.  
7  
8  
9

10  
11 These attempts at quantifying the 'soft' aspects of the performance reviews must  
12  
13 be understood in relation to the strong focus on billable hours at DM&I. While the  
14  
15 conversation clearly indicates that there are difficulties in creating clear-cut  
16  
17 measures, the partner insists on its feasibility. In terms of financialization, the  
18  
19 partner creates a direct link between 'soft' aspects of performance and financial  
20  
21 reward. Moving up from one level to another, e.g. from Consultant to Manager,  
22  
23 automatically means an increase in pay and also a higher billing fee. Thus, an  
24  
25 increase in 'business acumen' and other aspects would render a higher leverage  
26  
27 on billable hours. The logic underpinning the quantification effort is one where  
28  
29 'soft' aspects of work are transformed into the currency of billable hours.  
30  
31  
32  
33  
34  
35  
36  
37

38 Of course, not all partners agree in the possibility of actually measuring  
39  
40 performance in these aspects. Still, however, there is a belief in the fairness of  
41  
42 progression when it comes to investing in soft aspects.  
43  
44  
45  
46  
47

48 Er, well, we can't be mathematically precise about it, there is no machine  
49  
50 that can spit out a paper and say that it's three point seven this month. It  
51  
52 has to rely on judgement for measurement. [...] We know if John is a lone  
53  
54 wolf sitting in his office all day and we know that Lisa is a happy soul who  
55  
56  
57  
58  
59  
60  
61  
62  
63  
64  
65

1  
2  
3  
4 always have three co-workers on her missions. It's... pretty easy to see.  
5  
6 Even if it's hard to measure by the millimetre.  
7  
8  
9

10  
11 Formally, these judgements are supposed to be evaluated and quantified. Even if  
12  
13 everyone is not as confident as the spider web-drawing partner above, in the  
14  
15 peer review process a fact sheet about each individual's performance is  
16  
17 supposed to be produced, where each performance indicator is graded in five  
18  
19 steps ranging from 'poor' to 'exceptional'. In this system, the degree of  
20  
21 correspondence between quantified performance is more ambiguous, as each  
22  
23 indicator is supposed to have 'been seen in relation to career development' and  
24  
25 the manual also notes that the indicators have 'varying degrees of importance in  
26  
27 different phases of the career'.  
28  
29  
30  
31  
32  
33  
34  
35  
36  
37

38 Although there is a range of different performance measures at work within the  
39  
40 firm, they are not all valued in the same way. Despite significant lip-service being  
41  
42 paid to the 'soft' dimensions of the performance criteria, the 'harder' economic  
43  
44 dimensions of the performance reviews were clearly more important. Despite  
45  
46 attempts to upgrade the importance of soft measures, managers within the firm  
47  
48 acknowledged that these dimensions are very difficult to measure. In contrast the  
49  
50 'harder' dimensions such as billable hours are easily measured. The result is that  
51  
52 employees tend to focus on these measures. Indeed, directly quantifiable  
53  
54 outcomes that are closely tied to firm profitability are the major focus of most  
55  
56  
57  
58  
59  
60  
61  
62  
63  
64  
65

1  
2  
3  
4 employees' efforts. This is by no means unusual to PSFs. A recent study of a  
5  
6 manufacturing company found the preponderance of more 'despotic' modes of  
7  
8 control that imposed assessments on the basis of direct contribution to a firm's  
9  
10 financial performance (Ezzamel et al, 2008). Through linking these hard forms'  
11  
12 measures (such as contribution to profitability) to each individual's behaviour, the  
13  
14 firm was able to push the 'discipline of the financial markets' down to the level of  
15  
16 the workplace. But what is more surprising for us is that employees do not just  
17  
18 experience this as a form of despotic discipline (as Ezzamel et al, 2008 suggest),  
19  
20 but rather as an investment in their own future which may pay significant  
21  
22 dividends in the future.  
23  
24  
25  
26  
27  
28  
29  
30

#### 31 ***4.4 Putting a price on performance***

32  
33  
34  
35

36 It is quite clear that the billable time is the dominating indicator of performance.  
37  
38 As mentioned in section 4.1 above, several difficulties appear when trying to  
39  
40 value one's time in terms of billable hours. These difficulties are however only  
41  
42 one aspect to the problems of accumulating billable hours. Another regards the  
43  
44 fact that the hours billed on a particular job are the result of a negotiation  
45  
46 between (usually) a superior and a subordinate. The common way of organizing  
47  
48 work is that a senior person manages the client relation (cf. Alvehus, 2008). Work  
49  
50 tasks are either solved by the senior or handed to a more junior employee.  
51  
52 Before handing a solution over to the client, the senior employee reviews the job.  
53  
54  
55  
56  
57  
58 If s/he does the job her/himself, it is supposed to be reviewed by a peer (although  
59  
60  
61  
62  
63  
64  
65

1  
2  
3  
4 this only happens when the task is considered very difficult). The hours billed are  
5  
6 then shared between both consultants. In this process of 'sharing', employees  
7  
8 engage in a process of 'game playing' whereby billable hours are manipulated  
9  
10 and changed. A Consultant spells this out quite clearly:  
11  
12  
13  
14  
15

16 If you notice that you have to put in some more time, then the problem is  
17  
18 that you may have to seek assistance for either controlling your work or get  
19  
20 support from a Manager. And they are really expensive. And then you start  
21  
22 worrying about which parts of the work you want him to see in order to  
23  
24 avoid him from taking over the job entirely and start spending so much time  
25  
26 on it that there's nothing left for you. Or you can, if you have the  
27  
28 opportunity, hand it down to someone really cheap, someone who debits  
29  
30 as little as possible, and try to squeeze this person. Take me for instance, I  
31  
32 bill 1600 kronor [SEK] per hour, and we have a Manager, he bills let's say  
33  
34 2000 kronor. And you have a new Assistant who bills 900 kronor per hour.  
35  
36 And you know that this job is worth 10 000 at a maximum. If you're going to  
37  
38 do it yourself you quickly figure out that six hours, then you're at 9000  
39  
40 kronor, and a thousand for peer review, that doesn't work. 'Six hours, shit, I  
41  
42 can't do this in six hours.' Then you ask, maybe, let's say Eve, and you say  
43  
44 'Hell, why don't you do this job Eve, you get four hours maximum, not more  
45  
46 then four, maybe five.' You know what I'm getting at? You force her to do a  
47  
48 job you should have done yourself, could have done, but in order to keep  
49  
50 within the price, to avoid over-billing or not being able to get the client to  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60  
61  
62  
63  
64  
65

1  
2  
3  
4 pay, for instance, or in order to get some more time for yourself you  
5  
6 squeeze someone else, push it down to some Assistant who can do it  
7  
8 cheaper. And you can keep the margin for yourself, maybe review what  
9  
10 she has done, and go below the 10 000. So you can bill 10 000 without  
11  
12 having to go to a Manager. Or you spend a little time on it and when you  
13  
14 come to the manager it's just for him to read through, 'yes it's ok,' it's a  
15  
16 cheap way of dealing with it. This becomes a necessity because of the  
17  
18 system itself.  
19  
20  
21  
22  
23  
24

25  
26 Here, many aspects of the billing game are made clear. First, it's worth noting  
27  
28 that the person with the client relation not only has to relate to subordinates but  
29  
30 also to superiors. The amount of time available for reviewing has to be taken into  
31  
32 account. Second, it's worth noting that what cannot be billed to the client is  
33  
34 pushed downwards in the organization (since subordinates are cheaper). If it's  
35  
36 impossible to do a job yourself in six hours, it's perhaps possible to 'squeeze'  
37  
38 someone else into doing it in four or five hours. And the more subordinates you  
39  
40 have access to, the easier this becomes. If others do the job and you do the  
41  
42 review, leverage can be achieved for the individual. In this way, it is possible to  
43  
44 avoid non-billable hours, and one's time can be spent on more rewarding jobs.  
45  
46 This effectively puts an end to the idea that junior employees report the number  
47  
48 of hours they actually work.  
49  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60  
61  
62  
63  
64  
65

1  
2  
3  
4 At the same time, it is common to keep profitable jobs (where the client's  
5 willingness to pay is higher) for oneself. Also, sometimes the review process is  
6 seen as too encumbering and it is more efficient to do the job oneself rather than  
7 to delegate and review (the so-called 'under-delegation problem'; Maister, 1993),  
8 which in turn makes experience transfer and learning more difficult. And, as  
9 noted above, registering hours to one's own time report is considered a safe way  
10 of getting credit for one's work. As one partner said, 'the more time you can bill  
11 yourself, the more money in your wallet.'

12  
13  
14  
15  
16  
17  
18  
19  
20  
21  
22  
23  
24  
25  
26 This situation from a certain perspective looks rather diabolic. For the junior  
27 employee, however, there are quite instrumental reasons for engaging in this  
28 system. From the view of someone on the receiving end (Eve in the above  
29 quotation), there are basically three options: to bill the number of hours spent on  
30 a job, to under-bill or to over-bill. The latter option is attractive since it  
31 immediately impacts on billable time, and thereby facilitates progression. The  
32 possibility to over-bill is highly related to the kind of clients and jobs one works  
33 with.

34  
35  
36  
37  
38  
39  
40  
41  
42  
43  
44  
45  
46  
47  
48 The first time you do something it takes much more time. But if you just  
49 handled a question for another client you can perhaps copy the letter you  
50 wrote, and then I can bill some extra time that day, and that makes me  
51 happy.

1  
2  
3  
4 Over-billing is a lot less common than the opposite, but still it remains an option  
5  
6 for some. More commonly, the question is whether to bill the number of hours  
7  
8 worked or whether to under-bill. 'It's a question of marketing,' as an Assistant put  
9  
10 it. To get more assignments from a specific superior it is important to look  
11  
12 efficient, the Assistant explains, and to keep the number of billable hours down.  
13  
14  
15 And this is of course taken advantage of:  
16  
17  
18  
19  
20

21 If someone calls you and, he's going to get on his report how much  
22  
23 you bill, and he's going to bill the client, and if he calls me it costs  
24  
25 25 000 and if he calls Charlie it will cost 50 [000], I mean... [...] And  
26  
27 of course they take advantage of this.  
28  
29  
30  
31

32 As a junior, you compete on an internal market for assignments, with your peers  
33  
34 as competitors. In order to sell your services, prices have to be kept low. As a  
35  
36 junior, you still have no definite expertise, and thereby it is hard to gain a  
37  
38 competitive advantage by specialization. Price competition is the only option. In  
39  
40 order to gain repeat business, and thereby secure your future billing rate, under-  
41  
42 billing becomes a rational solution. Thus, while in the quotation from the  
43  
44 Consultant above the limitation in billing was enforced, there is a willingness from  
45  
46 junior employees to engage in this behaviour.  
47  
48  
49  
50  
51

52 Building up billable hours was seen as an investment. However, simply  
53  
54 accumulating hours was not the only strategy available to employees. There was  
55  
56 a range of other ways they could seek to build a stock of billable hours. This  
57  
58  
59  
60  
61  
62  
63  
64  
65

1  
2  
3  
4 often involved a process of arbitrage, i.e. exploiting possible imbalances in  
5  
6 various internal markets within the firm. This was facilitated by the fact that there  
7  
8 is a highly ambiguous relationship between time actually worked and time that is  
9  
10 billed to a client. This ambiguity provided significant room for manoeuvre in the  
11  
12 assignment of particular billable hours to particular tasks and particular people.  
13  
14 This ambiguity allowed the exploitation of imbalances in the types of people  
15  
16 doing the work (particularly between highly paid seniors and less well paid  
17  
18 juniors). Typically this involves a senior (or partner) using the services of a junior  
19  
20 (with a cheaper billing rate) to do the work. They would then 'share' some of the  
21  
22 hours with the junior under the pretence of supervisory time. This often involves  
23  
24 processes of intricate accounting whereby employees will consider the value of  
25  
26 the job, whether their charge out rate will allow them to complete it in time, and if  
27  
28 not, whether it can be shifted to a more junior employee (with some advantages  
29  
30 rendered to the employee themselves). This is what we call 'the billing game' – a  
31  
32 frequent process whereby seniors seek to exploit the relatively cheaper billable  
33  
34 hours of juniors within the firm, and in the process take a cut themselves.  
35  
36  
37  
38  
39  
40  
41  
42  
43  
44

45  
46 Another dimension to this 'billing game' is that seniors seek to avoid doing the  
47  
48 difficult tasks (tasks which will often take longer than what they can bill for – often  
49  
50 due to price sensitive clients) and monopolise what they see as easy jobs (tasks  
51  
52 which will taken a shorter amount of time than what they can bill – often due to  
53  
54 large, price insensitive clients). Because juniors have a lower charge out rate,  
55  
56 and are able to be 'squeezed' (i.e. render non-billable time after-hours) this sets  
57  
58  
59  
60  
61  
62  
63  
64  
65

up an imbalance which wily seniors are only too willing to exploit. Juniors are often only too willing to acquiesce in being exploited in such a way. One reason for this is that working overtime is a symbol for commitment to the organization (Coffey, 1994); something they hope might later be picked up in their performance reviews. A second reason is that juniors are completely reliant on their seniors for a stream of work. If a junior is seen as being compliant and helpful then their stream of (lower paid) work is likely to expand, subsequently meaning they are able to expand their 'investment' in billable hours more rapidly. However, if a junior is reluctant to take on difficult jobs and work overtime, then it is likely that they will be seen as non-compliant by seniors and their stream of work might begin to dry up. The result – spending too much time 'on the beach' (i.e. between projects and without any billable time) – could be the kiss of death in any PSF (cf. Evans et al, 2004).

## **5. Discussion and Conclusion**

In this paper we have examined how employees are controlled in a PSF. We found many of the control mechanisms in place one would expect in a PSF, such as professional knowledge bases (Abbott, 1991), human resource management systems (Maister, 1993), management by objectives (Covaleski et al, 1998), up-or-out systems (Baden-Fuller & Bateson, 1990), and forms of identity control (Alvesson, 2004). However, what seems to tie each of these systems together is an over-arching concern with investment in work. We have noted this involves

1  
2  
3  
4 the flow of work-time being quantified and valued through the technology of  
5  
6 billable hours (see also: Brown & Lewis, 2011). These billable hours are carefully  
7  
8 invested in by employees in the expectation that they might later convert them  
9  
10 into career advancement (in particular a partnership). Finally, this opens up  
11  
12 space for arbitrage whereby employees can convert other forms of currency  
13  
14 (such as good performance evaluations) into billable hours or exploit differential  
15  
16 rates for billable hours between seniors and juniors within the firm.  
17  
18  
19  
20  
21  
22

23  
24 What is particularly interesting here is how this notion of 'investment' was linked  
25  
26 to one specific form of control, financialization, within the organization (e.g.  
27  
28 Davis, 2009). According to existing studies, this process involves an attempt to  
29  
30 infuse the logic of investment and shareholder value into all business decisions  
31  
32 and aspects of organizational life (Ezzamel et al, 2008). It is interesting to note  
33  
34 the importance of the ideological aspect of financialization in the DM&I context,  
35  
36 as the firm is not publicly traded. Thus, pressure from investors to emphasise  
37  
38 financialized control forms is not apparent. Rather, Partners embracing it as part  
39  
40 of 'how the business works'. It is also associated with the increasing shift in  
41  
42 accountancy firms away from a logic of civic-professionalism towards a more  
43  
44 hard-nosed market-oriented logic (Hanlon, 1994, Leicht & Fennell, 2001;  
45  
46 Suddaby et al, 2009). In our study of DM&I, we found that the auditors did indeed  
47  
48 extensively use a financialized language and logic for talking about and thinking  
49  
50 of their work. This was based on fairly minimal instructions that have been a  
51  
52 stable feature of the firm that require auditors to report their own time and  
53  
54  
55  
56  
57  
58  
59  
60  
61  
62  
63  
64  
65

1  
2  
3  
4 allocate it to specific projects/clients. Thus the official version is that the number  
5  
6 of worked hours should be reported in a straight-forward and accurate fashion.  
7  
8 The manipulation of the system, which we term financialization, is based on an  
9  
10 understanding of the system as something that can and should be manipulated  
11  
12 and 'worked' in order to promote oneself within the firm. We have seen that  
13  
14 strategies for this vary, especially between junior and senior employees. However  
15  
16 it is important to note that these understandings are displayed in interpersonal  
17  
18 relations, and they do turn into a form of instruction. The demand to creatively  
19  
20 manipulate one's billable hours is a kind of skill that is widely known, rewarded  
21  
22 and informally taught, but not officially sanctioned. Indeed, it could be seen as a  
23  
24 certain kind of 'game playing' (McGivern & Ferlie, 2007) that allows people to not  
25  
26 just get the job done but also progress in their career.  
27  
28  
29  
30  
31  
32  
33  
34  
35

36 Of further importance is how financialization relates to the notion of time  
37  
38 employed in the use of billable hours. Billable hours can be seen as an allocation  
39  
40 of time (Hassard, 1989) according to 'clock time' (Ancona et al, 2001). As the  
41  
42 system is designed, there is supposedly a linear relation between time and  
43  
44 activity. The actors do, however, engage in several forms of manipulation of the  
45  
46 system. While time can be seen as either representing the unfolding of events or  
47  
48 as something experienced differently by different actors (Ancona et al, 2001;  
49  
50 Perlow, 1999), financialization creates a notion of time that is only vaguely  
51  
52 related to either the clock or to the experience of time. The relation between  
53  
54 actual time spent on activities and 'financialized time' is, as we have shown  
55  
56  
57  
58  
59  
60  
61  
62  
63  
64  
65

1  
2  
3  
4 above, quite loose. The billing game is somewhat dependent on the actual time a  
5  
6 task takes to perform, but other considerations as well. Billing rates make time  
7  
8 relative to certain actors, as some individuals' time is more valuable than others'.  
9  
10 This further loosens the link between 'clock time' and 'financialized time'. The  
11  
12 latter transforms time into a currency that is comparable with other aspects of  
13  
14 everyday work, such as the valuation of soft skills, and with other notions of time,  
15  
16 such as investments in the future.  
17  
18  
19  
20  
21  
22

23 As well as being a kind of game playing, the focus on billable hours was an  
24  
25 important form of employee control because it facilitated a process of self-  
26  
27 monitoring and self-management (Morris & Pinnington, 1998; Brown & Lewis,  
28  
29 2011). In the simplest terms, it focuses employees on work by ensuring that all  
30  
31 six-minute slots of the day are accounted for. But it also links a sense of an  
32  
33 employee's worth to the firm by directly quantifiable and measurable hours.  
34  
35 Finally, it places the accumulation of this worth in direct relationship with  
36  
37 developing a career within the firm. It does this by pushing the employee to not  
38  
39 only ensure that they are accumulating the most billable hours possible, but also  
40  
41 that they reflect and think about how it might be possible to accumulate ever-  
42  
43 more of this precious commodity. This contrasts with more traditional images of  
44  
45 professionals as being more concerned with tasks and knowledge than time *per*  
46  
47 *se* (Blyton et al, 1989).

64  
65

Each of these processes means that thinking about one's work as a kind of investment became central. Questions about what one should and should not do within the workplace became increasingly governed by the test of whether it would increase one's stock of capital. The result was that each employee came to think of themselves as financial investors and their work as a kind of investment. Working did not just mean executing tasks – it also meant investment, speculating and engaging in arbitrage with one's time. What is more, notions of investment continued to inform and discipline the working days and identities of each employee. Thus financialization was a central way that work was controlled in this particular setting.

Viewed from a managerial perspective, there are several reasons for developing and enforcing these systems. The increased emphasis on time measurement is a way of establishing a more precise control over how time is spent. Each individual becomes accountable for his or her contribution to the firm's profitability and this is all put in an easily manipulated and aggregated form. When firm value is reduced to simplistic financial measures, this creates a link between individual performance and firm value and reputation (Faulconbridge & Muzio, 2009). It also gives a clear track record of the historical performance of each individual, helping in deciding on promotions. The HRM system is partly a way of marketing the firm on the important input market (i.e. competing for top students to recruit). It is also a way of defining which behaviour and dispositions the firm wants to promote, it created an evaluation grid to which everyone is supposed to conform

(Townley, 1993). All in all, these systems can be construed as a way of establishing a more precise control over the firm's resources: time and the employees. This is also the way the situation is perceived by the senior partners in the firm. As was often noted at DM&I, all questions in the firm ultimately turn into what they called 'wallet questions' (whether the partners benefit from it financially).

By pointing out the role financialization plays in control of the workplace, we have extended existing research on financialization as a control strategy at the firm (Fligstein, 1990; Froud et al, 2000; Ezzamel et al, 2008; Faulconbridge & Muzio, 2009), market (Arrighi, 1994), and societal level (Martin, 2002; Davis, 2009). In particular we have suggested that financial techniques and processes of reasoning have come to infuse how employees think about their work, their careers, and indeed about themselves. We have noted that through emphasising billable hours, employees' work-time became understood purely in terms of this quantifiable measure (see also Anderson-Gough et al, 2001). This leads to a kind of internalised discipline whereby employees seek to invest their time at the firm wisely. This involves seeking to accumulate as many billable hours as possible, as billable hours become the preferred way of displaying performance and progression. It also leads to a kind of speculative attitude on the part of employees, whereby they would seek to increase their stock of investments – largely through the exploitation of junior colleagues. The result is that working life was experienced as one large market that should be skilfully negotiated in order

1  
2  
3  
4 to reap the benefits. This suggests that not only have we seen the financialization  
5  
6 of economy and firms; we have also seen the financialization of workplace  
7  
8 control.  
9

## 10 11 12 13 14 **6 Limitations and further research**

15  
16 Our findings are limited in a number of ways. First our findings are limited in  
17  
18 temporal scope. Our study only examines how financialization works in a recent  
19  
20 setting. This means that it is difficult to trace in detail the historical trajectory of  
21  
22 financialized control in this particular workplace. If we had examined this  
23  
24 historical dimension in more detail, it would have become possible to identify  
25  
26 when financialization became an important form of control in PSFs, whether  
27  
28 forms of financialized controls are particularly novel or if they have important  
29  
30 antecedents, and what were the conditions which drove the increasing  
31  
32 importance of financialized control.<sup>1</sup> By providing a historical and geographical  
33  
34 account of financialization, it might become possible to provide a more detailed  
35  
36 account of the underpinning drivers of financialized control in PSFs.  
37  
38  
39  
40  
41  
42  
43  
44

45  
46 A second major shortcoming is that we have focused on one kind of PSF (a Big  
47  
48 Four accountancy). In many ways this is exactly the kind of the environment  
49  
50 where one would expect to find employees using their training and expertise in  
51  
52 financial and accounting technologies to think about their own work time. It is  
53  
54

---

55  
56 1

57 As one of the anonymous reviewers pointed out, these systems  
58 have been around for quite some time in Anglo-American firms.  
59  
60  
61  
62  
63  
64  
65

possible to argue that the same may not be the case in PSFs which are less infused with financial technologies. On the other hand, we must note that the case discussed here is one where we would not necessarily expect pressures for financialization, as the shares of DM&I are not publicly traded and hence there is no external pressure for financialization. Rather, it seems that financialization has become part of how the business logic is perceived to operate, despite obvious counter-indicators (as actual revenues are only loosely coupled to hours worked). Would we find the same kind of financialization of workplace control in a legal office, in an architecture firm, or a design consultancy? What about outside the realm of professional services? Do we find the financialization of control in the manufacturing and service sectors? How about the public and non-profit sector? There is some evidence to suggest that the financialization of workplace control is not simply limited to the professional service workplace. For instance a number of writers have noted the increasing dominance of shareholder value within large corporations and the dominance of the work process by a range of technologies which are associated with ensure the increased in shareholder value (e.g. Ezzamel et al, 2008; Gleadle & Cornelieus, 2008; cf. Fiss & Zajac, 2004). This opens up the question of how generalised the financialization of workplace control has become?

The third clear limitation is that we have only studied one particular institutional context – namely an Anglo-American based Big Four accountancy in Sweden. Given the basis of this company largely within the Anglo-American institutions

1  
2  
3  
4 associated with shareholder driven capitalism (Whitley, 1999; Hall & Soskice  
5  
6 2001), it is not surprise that we find the financialization of workplace control. To  
7  
8 be sure, the fact the auditors were working in Sweden may have had an  
9  
10 important mediating effect – in particular it would have added elements of co-  
11  
12 operative and welfare oriented capitalism (Belfrage, 2008; Esping-Anderson,  
13  
14 1990). However, the Swedish context continues make a strong role for the  
15  
16 financial market oriented forms of control – particularly in more recent years  
17  
18 (Blom, 2007). International studies of PSFs tend to indicate that Anglo-Saxon  
19  
20 mores have some influence on how the firms organize work in a range of national  
21  
22 contexts (Boussebaa, 2009). Many PSFs have served as important sites that  
23  
24 have facilitated the travel of ideas and the creation of markets which have  
25  
26 actually created global spaces that nonetheless bare important imprints of their  
27  
28 national origins (e.g. Morgan & Quack, 2005). What remains to be seen is  
29  
30 whether this same kind of financialization of work is limited to Anglo-Saxon  
31  
32 dominated workplace or whether it can also be observed in workplaces that have  
33  
34 not traditionally been dominated by ‘restless’ financial capital such as Germany,  
35  
36 France and Japan.  
37  
38  
39  
40  
41  
42  
43  
44  
45  
46  
47

48 Fourth, there are notions of various labour markets that must be developed in  
49  
50 more detail. As noted by Faulconbridge and Muzio (2009), increasing  
51  
52 financialization seems to affect labour markets. Comparing the professionals at  
53  
54 DM&I with itinerant experts working through temporal contracts, there are striking  
55  
56 similarities in terms of the commodification of time and how activities become  
57  
58  
59  
60  
61  
62  
63  
64  
65

1  
2  
3  
4 targets for careful financial consideration (cf. Barley & Kunda, 2004; Evans et al,  
5  
6 2004). For contractors, time between contracts becomes a commodity that can  
7  
8 be invested in e.g. developing skills or in freedom from work. These  
9  
10 considerations are, for the 'ordinary' employee, managed through the  
11  
12 employment contract. When a firm employs financialized forms of control, the  
13  
14 investment considerations appear also within the employment contract. Investing  
15  
16 in the future, considering the importance of different skills, negotiating and  
17  
18 marketing oneself are important activities. To some degree, we find similar  
19  
20 characteristics between internal and external labour markets (Doeringer, 1967).  
21  
22 There are however differences that should be emphasised and investigated  
23  
24 further. Where itinerant professionals have mainly horizontal career trajectories  
25  
26 (job specific; see Barley & Kunda, 2004), the employed professional's  
27  
28 financialization involves a vertical dimension. For some, this can mean a degree  
29  
30 of security while for others it can become a difficulty (if career opportunities within  
31  
32 the firm seem bleak). In the first case, a return to employment is an option  
33  
34 (however often not desired; Barley & Kunda, *ibid.*). In the latter case, transitions  
35  
36 between different employers may become an option. Thus, the horizontal and  
37  
38 vertical dimensions can become blurred, and this should be a target for further  
39  
40 qualitative studies. Moreover, the bureaucratic relationship within a firm requires  
41  
42 more elaborate systems for e.g. translating between soft skills and the  
43  
44 financialized 'hard' currency (e.g. billable hours), while the marketing of skills  
45  
46 mainly involves billable hours. For the itinerant professional the question of  
47  
48 marketing is more open, e.g. involving presenting and delivering certain skills as  
49  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60  
61  
62  
63  
64  
65

1  
2  
3  
4 well as putting an hourly billing rate. While transactions are reduced to financial  
5  
6 transactions within market relations, this also creates a different system for  
7  
8 negotiating (in itself is an important skill for the itinerant professional). Thus, the  
9  
10 experience of career investment is framed differently, and how this impacts  
11  
12 subjectification through investing and tracing a career trajectory into the future  
13  
14 (Grey, 1994) should be studied in more detail.  
15  
16  
17  
18  
19  
20

21 The final question that is opened up by the global financial crisis is whether  
22  
23 financial logic and technology may have lost some of its legitimacy. Some  
24  
25 analyses have suggested that financialization led to an increasingly tenuous  
26  
27 relationship between the actual productive output of the firm and its  
28  
29 representation through the means of various accounting technologies (e.g. Froud  
30  
31 et al, 2004). Others have suggested that the financial crises suggest that one of  
32  
33 the central driving factors is financial and other business professionals giving up  
34  
35 on any notions of public service and instead being solely driven by market-based  
36  
37 criteria such as billable hours (Sikka, 2009). Still other commentators argue that  
38  
39 the severe problems generated by complex financial technologies have led to a  
40  
41 full-blown crisis in finance-dominated capitalism (e.g. Crouch, 2008). One of the  
42  
43 results is that firms may abandon the kind of financial logic and technologies that  
44  
45 produced many of these results. A second outcome may be that the power of  
46  
47 financial capital over corporations will markedly decline, particularly with  
48  
49 increasing state investments in some industries and even wholesale  
50  
51 nationalization programmes. This could mean that firms no longer are called  
52  
53  
54  
55  
56  
57  
58  
59  
60  
61  
62  
63  
64  
65

1  
2  
3  
4 upon to justify their operations in the language of financial returns, but use some  
5  
6 as yet unidentified new scheme of justification. This remains to be seen, but it is  
7  
8 certain that tracing the shifting power of finance and scope of financialization  
9  
10 following the global financial crisis would certainly repay further study.  
11  
12  
13
